NEW NON-INVASIVE WRINKLE TREATMENT APPLICATOR FROM SYNERON

Syneron Medical Ltd. announced that the FDA granted a 510(k) marketing clearance to Syneron's new ST applicator for non-invasive wrinkle treatment.

Using the ST applicator, the ReFirme procedure offers patients a non-invasive, less painful alternative for skin tightening and wrinkle reduction on the neck, face and other areas. The ReFirme treatment with the ST applicator uses a pulse repetition rate of one pulse per second and uses Syneron's elôs (electro-optical synergy) technology. The lower energy level needed to power the ReFirme allows patients to be treated with less pain than is typically associated with skin tightening and wrinkle improvement treatments.

The new ST applicator works with both the new eLight and the eMax platforms. Both platforms combine electrical energy (bi-polar radio frequency) and optical energy to enable efficient and safe treatments for patients.

The ST applicator expands the broad range of functions of these two recently launched platforms. The eLight is Syneron's new complete elôs facial treatment system. In addition to now treating wrinkles using the ST applicator, the eLight can also be used to treat vascular and pigmented lesions and acne conditions with additional applicators. The eMax is the complete elôs workstation, covering all of the capabilities of the eLight and providing high-speed, laser-based hair removal and treatment for leg veins. ■
